Task 4: Compare Results and Reflect

The baseline model performed poorly on my personal gesture style, with digits 2, 3, 4, 5, 6, 8, and 9 frequently misclassified. This is expected, as the baseline was trained on a generic dataset that does not reflect my individual way of drawing digits in the air.

After fine-tuning with my personally collected gesture data, recognition improved slightly. Digits 2, 3, and 6 became more reliable, while 4, 5, 8, and 9 remained difficult to classify correctly. The fine-tuned model was better aligned with my gesture style overall, but the improvement was

limited due to the small size of my personal dataset (10–24 samples per digit, well below the recommended 100).

In conclusion, fine-tuning did help for my specific gesture style, but collecting more data per digit would be necessary to achieve substantial accuracy gains.
